

Everything built this cycle, checked against a live system

Eight workstreams · 68 files changed · 3 database migrations

Verified 20 September 2026 against the production database and a production build

Working. 40 of 41 live checks passed, nothing failed.

The single warning is a configuration choice waiting on you, not a defect: three of five properties have no GSTIN saved, so they will add no tax to bills. One real bug was found during this check and fixed — the readiness probe was reporting the database as down while it was up.

What was built, and whether it works

WORKSTREAM	WHAT IT DOES	VERIFIED BY	STATE
GST correctness	Four defects fixed: composition dealers were charging tax they may not collect; rooms were taxed at one flat rate instead of the per-night slab; that rate still defaulted to the withdrawn 12%; the folio and the stay invoice disagreed on extras.	18 billing outcomes tested against real menu and room prices	PASS
On-time promise	"On your table in 30 minutes or the food is free." Owner sets the window and the percentage; the kitchen sees a countdown; the till shows the verdict and the cashier can overrule it.	All five billing outcomes, including a zeroed bill	PASS
Pantry at the till	The POS says how many portions the shelf can still cover, per dish, before a waiter promises it to a table. Warns, never blocks.	25 dishes costed, live	PASS
AI assistance	Six suggestion features — take an order in plain words, fill a dish, propose a recipe from your own pantry, match aggregator lines, draft a review reply, write a tagline. Every one is a suggestion a person then saves.	Compiles and degrades correctly; no live model call yet	KEY
Install anywhere	A Windows installer, an Android build path, iPhone home-screen install, and one <code>/get</code> page that hands each device the right one.	<code>/get</code> answers 200 signed-out, in 28 ms	PASS
Reliability	A dead database no longer becomes a redirect loop; sign-out clears cached pages from shared tills; a real readiness probe.	Probe returns <code>db: up</code> in 68 ms	PASS

WORKSTREAM	WHAT IT DOES	VERIFIED BY	STATE
Caching & speed	A cookie read in the root layout was making every route uncacheable. Removed — 7 routes now prerender.	Production build output	PASS
The gate itself	<code>pnpm lint</code> had been broken and silently linting nothing. Restored, 83 findings cleared, and CI now runs typecheck, lint and build on every push.	0 errors across the monorepo	PASS

The one bug this check caught

The readiness probe at `/api/health?deep=1` was answering **503 • database down** while the database was perfectly healthy. It tested PostgREST's root path, which — with the newer publishable key format your project uses — is a secret-key-only endpoint and answers 401. A monitoring system wired to it would have paged someone at three in the morning for nothing.

It now reads one row id from the smallest table the app always has, which proves the whole chain: PostgREST reachable, Postgres answering behind it, and the key still valid. Re-tested: `{"ok":true,"db":"up","db_ms":133}`.

Live test results

Run against the production database. Every test that writes does so inside a transaction that is rolled back, so no test data remains — confirmed as its own check.

CHECK	MEASURED	RESULT
Migrations — 4 of 4 passed		
0064_dish_stock_at_the_till	applied	PASS
0065_on_time_promise	applied	PASS
0066_gst_correctness	applied	PASS
total applied	70 files	PASS
Database — 11 of 11 passed		
menu_stock()	1 signature(s), authenticated may execute	PASS
place_order()	2 signature(s), authenticated may execute	PASS
generate_bill()	1 signature(s), authenticated may execute	PASS
gst_collectable()	1 signature(s), authenticated may execute	PASS
room_gst_for()	1 signature(s), authenticated may execute	PASS
folio_totals()	1 signature(s), authenticated may execute	PASS
generate_stay_invoice()	1 signature(s), authenticated may execute	PASS
session_bundle()	1 signature(s), authenticated may execute	PASS
kots_needs()	1 signature(s), authenticated may execute	PASS
no ambiguous RPC overloads	0 stale signature(s)	PASS
served_at delivery trigger	installed on order_items	PASS
Functionality — 9 of 9 passed		
session bundle resolves	property "manoooo"	PASS
new GST fields reach the app	via to_jsonb(restaurants)	PASS
promise fields reach the app	promise_enabled/minutes/pct	PASS
pantry cover per dish	25 dishes costed, e.g. 500 portions	PASS
order takes the on-time promise	deadline + rate snapshotted	PASS
plain bill unchanged by new code	Rs 399.00	PASS
promise fee charged when kept	Rs 19.00 on Rs 380	PASS
late promise zeroes the bill	waived Rs 380.00	PASS

CHECK	MEASURED	RESULT
all live tests rolled back	no test data left in the database	PASS
Compliance — 7 of 8 passed		
composition charges no tax	total Rs 380.00 = food only	PASS
regular dealer charges CGST+SGST	Rs 9.50 + Rs 9.50	PASS
room slab boundary at Rs 7,500	at or below 5%, above 18%	PASS
folio matches the stay invoice	Rs 6560.00 vs Rs 6560.00	PASS
two rates on one invoice	room 5%, spa 18%	PASS
suite above the slab taxed at 18%	Rs 9,000/night	PASS
properties that will charge no tax	3 of 5 have no GSTIN saved	WARN
no property on the withdrawn 12% room rate	0 found	PASS
Performance — 5 of 5 passed		
index recipe_items_menu_idx	present	PASS
index orders_promise_due_idx	present	PASS
open orders by property	0.0 ms, index	PASS
promised orders due	0.0 ms, index	PASS
recipe lines for a menu	0.1 ms, seq scan	PASS
Data — 4 of 4 passed		
no orphaned bills	0 found	PASS
no negative bill totals	0 found	PASS
CGST equals SGST on every bill	0 mismatched	PASS
estate size	5 properties, 60 dishes, 85 recipe lines, 2485 orders, 2477 bills, 50 bookings	PASS

Performance

Response times, production build

Best of three requests against `next start`. Development-server timings are two orders of magnitude slower and mean nothing — they include compiling the page on demand.

ROUTE	WHAT IT IS	RELATIVE	HTTP	TIME
<code>/login</code>	Sign in		200	4 ms
<code>/signup</code>	Sign up		200	4 ms
<code>/forgot</code>	Forgot password		200	4 ms
<code>/get</code>	Install page		200	28 ms
<code>/offline</code>	Offline fallback		200	3 ms
<code>/dine</code>	Public discovery		200	69 ms
<code>/dine/track</code>	Order tracking		200	3 ms
<code>/api/health</code>	Liveness probe		200	3 ms
<code>/api/health?deep=1</code>	Readiness probe (checks the database)		200	68 ms
<code>/manifest.json</code>	App manifest		200	2 ms

Database operations

Measured on the live database, including network round trip from this machine.

OPERATION	RELATIVE	TIME
Load who you are and where you work (every page) <code>session_bundle()</code>		42 ms
Pantry cover for the whole menu <code>menu_stock()</code>		39 ms
Place an order <code>place_order()</code> no promise		92 ms
Place an order with the on-time promise <code>place_order()</code> with promise		47 ms
Raise a bill <code>generate_bill()</code> plain		145 ms
Raise a bill with the promise fee <code>generate_bill()</code> promise kept		72 ms
Hotel folio and its tax invoice <code>folio_totals</code> + stay invoice		326 ms
Query: open orders <code>open orders by property</code>		< 1 ms

OPERATION	RELATIVE	TIME
Query: promise deadlines due promised orders due		< 1 ms
Query: recipe lines recipe lines for a menu		< 1 ms

Query plans on the paths that run most

QUERY	PLAN	TIME
Open orders for a property	index scan	< 0.1 ms
Orders with a promise deadline due	index scan	< 0.1 ms
Recipe lines behind a menu	sequential scan — 85 rows, correct choice at this size	0.1 ms

What ships to the browser

MEASURE	VALUE	READING
Shared JavaScript, every page	103 kB	Unchanged across this cycle despite six new features
Heaviest route (/billing)	267 kB	Normal for a till screen with printing and payments
Middleware	93 kB	Runs on every request; excludes static files
Routes built	68	7 now prerender, which was 0 before this cycle
Production compile	8.5 s	35 s including typecheck and lint

Open items — four need you, not code

ITEM	WHY IT MATTERS	TO RESOLVE
Three properties have no GSTIN Tanvi's, Mass, Jeevi's	They are marked <i>regular</i> but no GSTIN is saved, so bills now carry no CGST or SGST. That is correct in law — collecting tax unregistered is not allowed — but if these are registered businesses they are under-collecting from the next service onwards.	Enter the GSTIN in Settings, or set the scheme to <i>unregistered</i>
The AI features have no key	<code>ANTHROPIC_API_KEY</code> is unset, so every suggestion button is hidden and the app behaves exactly as it did before. Nothing is broken; the features are simply off, and have never been exercised against the live model.	Add the key to <code>apps/web/.env.local</code>
The deployment is private	Your Vercel URL is behind Deployment Protection, so staff opening <code>/get</code> , the phone app, or the desktop app see Vercel's login page instead of DineFlow. This blocks every install path.	Vercel → Settings → Deployment Protection

ITEM	WHY IT MATTERS	TO RESOLVE
Installer links unset	The <code>/get</code> page reads "not published yet" for Windows and Android until the built files are hosted somewhere and the two addresses are set.	Upload the installers, set the two <code>NEXT_PUBLIC_DOWNLOAD_*</code> variables

What this report does not prove

- There are still no automated tests.** CI proves the app compiles, typechecks and lints on every push. Nothing proves a bill totals correctly tomorrow except the checks run by hand for this report. The highest-value next step is unit tests on the money and tax maths in `packages/shared`, so the 18 billing outcomes verified today are re-verified on every change.
- **No screen was opened by a human.** Every screen behind sign-in was verified by exercising the database functions it calls, not by clicking through it. The public pages were loaded for real.
 - **The AI features have never called the model.** They compile, and they hide themselves correctly without a key. Their prompts and their output handling are unproven against live responses.
 - **Print output was not checked on paper.** The receipt changes for the promise line and the composition declaration were verified in code, not on a thermal printer.
 - **Load was not simulated.** Timings are single-user. Nothing here says what happens at fifty tills at once.
